PS C:\Windows\system32> Ad Login
Microsoft Edge browser has been opened at https://login.microsoftonline.com/common/oauth2/nativeclient. Please continue the login on chrome browser. If the web browser is available or if the web browser fails to open, use device code flow with -a Login --use-device-code
+ CategoryInfo          : ObjectNotFound: (WindowsPowerShell::Invoke-WebRequest) [Invoke-WebRequest], FileNotFoundException
+ FullyQualifiedCommandName : Invoke-WebRequest
[INFO] You have logged in. Now set as Pwd all the subscriptions to which you have access...
```

The screenshot shows the Microsoft Edge browser window with the title "Login successfully". The address bar contains the URL "https://login.microsoftonline.com/common/oauth2/nativeclient". A red box highlights the status message at the bottom of the page: "You have logged into Microsoft Azure!". Below this, a smaller message says "You can close this window, or we will redirect you to the [Azure CLI documents](#) in 10 seconds."

#5123 Azure CLI Task – Can't run more than 1 command?

 6 comments

 **iyerusad** opened on August 25, 2017

Command

```
site connectionstring show "conn1"
"Server=tcp:sample1.database.windows.net:1433;Database=NewDB;User
ID=User1;Password=Password1;Trusted_Connection=False;Encrypt=True;Connection Timeout=30;""
"SQlAzure" salessite1
```

site log download salessite1

tail salessite1

Braindump2go.com

site connectionstring show salessite1

site connectionstring add "conn1"
"Server=tcp:sample1.database.windows.net:1433;Database=NewDB;User
ID=User1;Password=Password1;Trusted_Connection=False;Encrypt=True;Connection Timeout=30;""
"SQlAzure" salessite1

site connectionstring list salessite1

Answer Area

Azure cli commands pdf. Azure cli commands reference. Azure cli commands download. Azure cli commands list. Azure cli commands examples. Azure cli commands cheat sheet. Azure cli commands in powershell. Azure cli commands for vmware.

az account Manage Azure subscription information. az acr Manage private registries with Azure Container Registries. az ad Manage Azure Active Directory Graph entities needed for Role Based Access Control. az advisor Manage Azure Advisor. az aks Manage Azure Kubernetes Services. az apim Manage Azure API Management services. az appconfig Manage App Configurations. az appservice Manage App Service plans. az aro Manage Azure Red Hat OpenShift clusters. az artifacts Manage Azure Artifacts. az backup Manage Azure Backups. az batch Manage Azure Batch. az boards Manage Azure Boards. az cache Commands to manage CLI objects cached using the --defer argument. az cloud Manage registered Azure clouds. az cognitiveservices Manage Azure Cognitive Services accounts. az config Manage Azure CLI configuration. This command is interactive. az cosmosdb Manage Azure Cosmos DB database accounts. az deployment Manage Azure Resource Manager template deployment at subscription scope. az deployment-scripts Manage deployment scripts at subscription or resource group scope. az deploymentmanager Create and manage rollouts for your service. az devops Manage Azure DevOps organization level operations. az disk Manage Azure Managed Disks. az disk-access Manage disk access resources. az disk-encryption-set Disk Encryption Set resource. az eventhubs Manage Azure Event Hubs namespaces, eventhubs, consumergroups and geo recovery configurations - Alias. az extension Manage and update CLI extensions. az feature Manage resource provider features. az feedback Send feedback to the Azure CLI Team! az find I'm an AI robot, my advice is based on our Azure documentation as well as the usage patterns of Azure CLI and Azure ARM users. Using me improves Azure products and documentation. az functionapp Manage function apps. To install the Azure Functions Core tools see . az group Manage resource groups and template deployments. az hdinsight Manage HDInsight resources. az image Manage custom virtual machine images. az iot Manage Internet of Things (IoT) assets. az keyvault Manage KeyVault keys, secrets, and certificates. az kusto Manage Azure Kusto resources. az lock Manage Azure locks. az login Log in to Azure. az logout Log out to remove access to Azure subscriptions. az managedservices Manage the registration assignments and definitions in Azure. az monitor Manage the Azure Monitor Service. az mysql Manage Azure Database for MySQL servers. az netappfiles Manage Azure NetApp Files (ANF) Resources. az network Manage Azure Network resources. az openshift Manage Azure Red Hat OpenShift Services. az pipelines Manage Azure Pipelines. az policy Manage resource policies. az postgres Manage Azure Database for PostgreSQL servers. az ppg Manage Proximity Placement Groups. az provider Manage resource providers. az redis Manage dedicated Redis caches for your Azure applications. az relay Manage Azure Relay Service namespaces, WCF relays, hybrid connections, and rules. az repos Manage Azure Repos. az resource Manage Azure resources. az rest Invoke a custom request. az role Manage user roles for access control with Azure Active Directory and service principals. az search Manage Azure Search services, admin keys and query keys. az security Manage your security posture with Azure Security Center. az self-test Runs a self-test of the CLI. az servicebus Manage Azure Service Bus namespaces, queues, topics, subscriptions, rules and geo-disaster recovery configuration alias. az sf Manage and administer Azure Service Fabric clusters. az signalr Manage Azure SignalR Service. az snapshot Manage point-in-time copies of managed disks, native blobs, or other snapshots. az sql Manage Azure SQL Databases and Data Warehouses. az staticwebapp Manage static apps. az storage Manage Azure Cloud Storage resources. az synapse Manage and operate Synapse Workspace, Spark Pool, SQL Pool. az tag Tag Management on a resource. az upgrade Upgrade Azure CLI and extensions. az version Show the versions of Azure CLI modules and extensions in JSON format by default or format configured by --output. az vm Manage Linux or Windows virtual machines. az vmss Manage groupings of virtual machines in an Azure Virtual Machine Scale Set (VMSS). az webapp Manage web apps. Manage Azure CLI configuration. This command is interactive. az configure [--defaults] [-list-defaults {false, true}] [--scope {global, local}] Examples Set default resource group, webapp and VM names. az configure --defaults group=myRG web=myvm Clear default webapp and VM names. az configure --defaults vm=" web=" Optional Parameters --defaults -d --list-defaults -l --scope Global Parameters Send feedback to the Azure CLI Team! az feedback Global Parameters I'm an AI robot, my advice is based on our Azure documentation as well as the usage patterns of Azure CLI and Azure ARM users. Using me improves Azure products and documentation. az find [] Examples Give me any Azure CLI group and I'll show the most popular commands within the group. az find "az storage" Give me any Azure CLI command and I'll show the most popular parameters and subcommands. az find "arm template" Optional Parameters Global Parameters Log in to Azure. az login [--allow-no-subscriptions] [--identity] [--password] [--service-principal] [-tenant] [-use-cert-sn-issuer] [-use-device-code] [-username] Log in interactively. az login Log in with user name and password. This doesn't work with Microsoft accounts or accounts that have two-factor authentication enabled. Use -p=secret if the first character of the password is '-'. az login -u johndoe@contoso.com -p VerySecret Log in with a service principal using client secret. Use -p=secret if the first character of the password is '-'. az login --service-principal -u -p VerySecret --tenant contoso.onmicrosoft.com Log in with a service principal using client certificate. az login --service-principal -u -p ~/mycertfile.pem --tenant contoso.onmicrosoft.com Log in using a VM's system assigned identity az login --identity Log in using a VM's user assigned identity. Client or object ids of the service identity also work az login --identity -u /subscriptions/resourceGroups/myRG/providers/Microsoft.ManagedIdentity/userAssignedIdentities/myID --allow-no-subscriptions --identity -i --password -p --service-principal --tenant -t --use-cert-sn-issuer --use-device-code --username -u Global Parameters Log out to remove access to Azure subscriptions. az logout [-username] Optional Parameters --username Global Parameters az rest Invoke a custom request. This command automatically authenticates using the logged-in credential: If Authorization header is not set, it attaches header Authorization: Bearer , where is retrieved from AAD. The target resource of the token is derived from --url if --url starts with an endpoint from az cloud show --query endpoints. You may also use --resource for a custom resource. If Content-Type header is not set and --body is a valid JSON string, Content-Type header will default to application/json. az rest --uri [-body] [--headers] [--method {delete, get, head, options, patch, post, put}] [-output-file] [-resource] [-skip-authorization-header] [-subscription] [-uri-parameters] Examples Get Audit log through Microsoft Graph az rest --method get --url Update a Azure Active Directory Graph User's display name az rest --method patch --url "azuresdkteam.onmicrosoft.com" --body "{\"displayName": \"jondoe2\"}" Get a virtual machine az rest --method get --uri /subscriptions/{subscriptionId}/resourceGroups/{resourceGroupName}/providers/Microsoft.Compute/virtualMachines/{vmName}?api-version=2019-03-01 Create a public IP address from body.json file az rest --method put --url subscriptionId}/resourceGroups/{resourceGroupName}/providers/Microsoft.Network/publicIPAddresses/{publicIpAddressName}?api-version=2019-09-01 --body @body.json List the top three resources (Bash) az rest --method get --url subscriptionId}/resources?api-version=2019-07-01 --url-parameters \$top=3 Required Parameters --uri --url -u --body --headers --method -m --output-file --resource --skip-authorization-header --subscription --uri-parameters Global Parameters az self-test Runs a self-test of the CLI. az self-test [-subscription] Optional Parameters --subscription Global Parameters az upgrade Upgrade Azure CLI and extensions. az upgrade [--all {false, true}] [-subscription] [-yes] Optional Parameters --all --subscription --yes -y Global Parameters az version Show the versions of Azure CLI modules and extensions in JSON format by default or format configured by --output. az version [-subscription] Optional Parameters --subscription Global Parameters A Jenkins plugin to use Azure CLI for managing Azure resources. The advantage of this plugin that it let's you export the CLI result from each command to environment variables and to the next command. How to Install You can install/update this plugin in Jenkins update center (Manage Jenkins -> Manage Plugins, search Azure CLI Plugin). You can also manually install the plugin if you want to try the latest feature before it's officially released. To manually install the plugin: Clone the repo and build: mvn package Open your Jenkins dashboard, go to Manage Jenkins -> Manage Plugins. Go to Advanced tab, under Upload Plugin section, click Choose File. Select azure-cli.hpi in target folder of your repo, click Upload. Restart your Jenkins instance after install is completed. Deploy & Manage Azure Resources Prerequisites To use this plugin, first you need to have an Azure Service Principal in your Jenkins instance. Create an Azure Service Principal through Azure CLI or Azure portal. Open Jenkins dashboard, go to Credentials, add a new Microsoft Azure Service Principal with the credential information you just created. Install Azure CLI in the Jenkins Host How to use Select Azure CLI Plugin in the Build Steps. Select the Azure Service Principal Type a command such as az vm create -n MyLinuxVM -g MyResourceGroup --image UbuntuLTS --data-disk-sizes-gb 10 20 You can also use environment variables: az vm create -n \${VM_NAME} -g MyResourceGroup --image UbuntuLTS --data-disk-sizes-gb 10 20 Export output as environment variables The CLI command output is JSON based: Output: { "fqdns": "", "id": "/subscriptions/some-guid/resourceGroups/MyResourceGroup/providers/Microsoft.Compute/virtualMachines/MyLinuxVM", "location": "northeurope", "macAddress": "00-0D-AA-AA-AA-AA", "powerState": "VM running", "privateIpAddress": "52.178.0.0", "properties": { "provisioningState": "Succeeded" }, "resourceGroup": "MyResourceGroup" } If you want to export a property to an environment variable that you can use in other build steps, define the parameters in the "advanced" section: /publicIpAddress|PUBLIC_IP The '/publicIpAddress' is the path in the JSON and the 'PUBLIC_IP' is the environment variable that will be created. Nested property: /properties/provisioningState|STATE Multiple environment variables: /publicIpAddress|PUBLIC_IP , /properties/provisioningState|STATE {height="400"} Deploy using Pipeline You can also use this plugin in pipeline (Jenkinsfile). Here are some samples to use the plugin in pipeline script: To create a new resource group and provision a new VM: azureCLI commands: [[exportVariablesString: "script: 'az group create -n MyResourceGroup --location northeurope'", exportVariablesString: '/publicIpAddress|PUBLIC_IP', script: 'az vm create -n MyLinuxVM -g MyResourceGroup --image UbuntuLTS --data-disk-sizes-gb 10 20']], principalCredentialId: " For advanced options, you can use Jenkins Pipeline Syntax tool to generate a sample script. Deploy using Job DSL You can also use this plugin with using the Jobs DSL. For example: To create a linux VM using the CLI: job('AzCommand') { steps { azCommands('servicePrincipalId', ['az vm create -n MyLinuxVM -g MyResourceGroup --image UbuntuLTS --data-disk-sizes-gb 10 20 && /publicIpAddress|PUBLIC_IP']) } } Changelog Version 0.9 (2018-6-28) Fixed runtime exec in Linux Version 0.8 (2018-6-19) Version 0.7 (2018-6-4) Disabled print login command Version 0.6 (2017-9-8) Version 0.4 (2017-8-20) Version 0.2 (2017-8-17) Version 0.1 (2017-8-16) Initial release Support Azure CLI 2.0 Support export environment variable from each command output Deploy using Job DSL
